PROFESSIONAL SUMMARY

AI Engineer focused on production LLM agents and backend platforms for enterprise SaaS, using Python, FastAPI, LangGraph, AWS Bedrock and the Model Context Protocol (MCP). Experience includes retrieval, multilingual search, LLM evaluation and observability, as well as AI-assisted code review and merge-request workflows in GitLab CI. Foundation in full-stack product engineering and cloud infrastructure.

PROFESSIONAL EXPERIENCE

Avature **Buenos Aires, Argentina**

AI Engineer *September 2025–Present*

- Build and improve production AI agents for Avature Copilot, supporting candidate search and applications, scheduling, insights and knowledge-base Q&A using Python, FastAPI, LangGraph and AWS Bedrock.
- Migrated seven agents to a shared prompt architecture with reusable snippets and customer-editable instructions, and aligned agent configuration across product and orchestration services.
- Extended MCP integrations by organizing platform tools, adding configurable wildcard tool groups and validating requests before workflows are submitted.
- Delivered locale-aware knowledge retrieval across the platform, orchestration service, AI gateway and crawler, so answers can cite sources in the customer's language.
- Contributed to the internal AI gateway with asynchronous rate limiting, Bedrock latency and throttling metrics, dynamic OpenAI model support and CI reliability improvements.
- Built agent regression and calibration tests, and authored reusable GitLab CI jobs and agent skills for AI code review and merge-request overviews.

Software Engineer *August 2024–August 2025*

- Developed and maintained an integrated application suite spanning the PHP end-user platform, Java crawlers and API integrations, and a TypeScript browser extension.
- Designed and maintained the browser extension with a React frontend and Node.js backend.
- Built Java crawlers to scrape job boards or communicate with their APIs, parsing responses into user-specific datasets.
- Built and maintained the PHP application, integrating extension and crawler capabilities for end users; fixed defects and delivered features across the suite in collaboration with cross-functional teams.
- Also delivered sourcing features, retired legacy job-board integrations, modernized PHP with PSR-4 migrations and type hints, and contributed early Copilot and semantic-search integrations.

PROFESSIONAL EXPERIENCE · CONTINUED

Avature **Buenos Aires, Argentina**
Cloud Engineer *March 2022–July 2024*

- Led server provisioning, lifecycle and configuration work across cloud platforms and Linux environments, including on-call response to critical incidents.
- Improved monitoring and incident response by refining alarm severity and routing, reducing false positives and aligning alerts with service ownership.
- Automated recurring operational workflows and partnered with teams to strengthen monitoring and infrastructure reliability.

IBM — Kyndryl **Buenos Aires, Argentina**
Sysadmin Unix *November 2019–March 2022*

- Administered Red Hat Linux, AIX and Solaris systems, covering capacity planning, maintenance, installation, upgrades, troubleshooting and on-call support.
- Led server and data migrations and implemented Ansible automation to reduce manual ticket-resolution work.

EDUCATION

University of Buenos Aires **Buenos Aires, Argentina**
Computer Science · Incomplete *March 2017*

SKILLS

Languages: Python, PHP, TypeScript, Java, Solidity
Frameworks: FastAPI, Hardhat, Foundry, React
AI engineering: LangGraph, LangChain, MCP, AWS Bedrock, OpenAI, RAG, prompt engineering, LLM evaluation
Search and backend: Elasticsearch and vector search, embeddings, Redis/Celery
Quality and observability: GitLab CI, Docker, OpenTelemetry, Phoenix, Prometheus, Grafana, Linux, AWS, Git, Tailwind
AI developer tooling: Devin, Windsurf, Codex, Opencode, Claude Code, herdr

PROJECTS

Trading Strategy Tester

- Built a CLI backtesting runner to compare strategy variants across assets and timeframes, with configurable risk, exit modes, sessions and transaction costs.
- Implemented deterministic OHLC execution simulation and generated performance reports with trade charts.

Pokémon Voting DApp

- Built a Solidity/React voting DApp with wallet-based registration, one vote per user and admin-managed candidates; stored profile images on IPFS and deployed and verified the contract on Ethereum Sepolia.
